Prompts	Why?	Incorporated as
Explain BPE	To further understand BPE (top level, core idea of what BPE does, not the python implementation of it)	BPE was explained, and certain questions answered
python boilerplate code generation	To help with writting random boiler plate code, e.g. prettier printing of results in console, certain plots, random bits and pieces here and there, etc.. Generally simple things that I already know exactly how to code by myself, but might have taken too long to get just right, because of e.g. strange data structures, library specific quirks (e.g. matplotlib), etc.. I think you got the idea.	Everything that was generated was carefully read, and altered/corrected where was needed. For example the functions analyse() and plot_vocab_allocation() inside of vocab_alocation.py were initially LLM generated.
transformer optimization	after implementing the transformer in a really basic way, I asked for help with ‘optimization’. Mostly for myself to better understand the general implementation of a transformer, ways to improve it, and how extra components alter the behaviour, rather than to actually ‘optimize it’s performance’	asside from some bugfixing, this turned out way more beneficial than I initially thought would be, because I got introduced with certain components and cool methods that I didn’t even knew their existence before (e.g. autocast, clip_grad_norm, lr_scheduler, etc..).
help with latex	to get help with latex, because I have never used it before. The template is really helpful, but I was encountering/introducing bugs and I had no clue how to solve	got a lot of help, solved most of the problems and I did manage to get an alright grasp of Latex. but there were things that still didn’t want to cooperate with me, so I eventually gave up and resorted to my usual .md way..
